Overall Objectives of Our E3SM Project

- Advance the treatment of land disturbance, particularly **LULCCs and land management practices**, within an IAM and couple it with E3SM to fully explore the potential contribution of
 - LULCC and land management practices to carbon emissions and mitigation opportunities
 - Terrestrial carbon sources and sinks, and climate change
- Tasks:
 - Improving the historical distribution of LULCC in E3SM.
 - Implementation of Global-Scale Spatial Dynamic Allocation Model (SDAM) of agricultural land use change in GCAM-E3SM coupled modeling framework
 - **Modeling land management practices that influence carbon sinks in terrestrial agriculture and forest ecosystems and mitigate climate change**

Representation of Land Management in Current Land Models

- Missing components of current land models:
 - Most land models have a very simple or no representation of land management practices
 - Carbon and nitrogen dynamics of the livestock feed-manure cycle have not been accounted for
- In this talk
 - Implement land management practices into a land surface model to estimate carbon fluxes
 - Estimate carbon fluxes from land management (farmland emissions, E_{farm}) and agricultural land use change (E_{luc})

Framework: agricultural land management

- Implementation of the livestock feed-manure cycle
 - Harvest process for crop grain
 - Crop residual treatment
 - Livestock grazing
 - Manure
- N fertilizer (Chemical)
- Tillage process
- Irrigation
- Burning

Net CO₂ flux

- +ve (Source)
- ve (Sink)

Livestock feed-manure cycle and its impact on C and N dynamics

1. Estimation of country scale feed demand (carbon) based on the feed requirement (*Krausmann et al, 2008*) for 16 major livestock

$$\sum \text{Livestock head} \times \text{Feed demand per animal}$$

2. Quantification of the feed sources (cropland and grazing land)

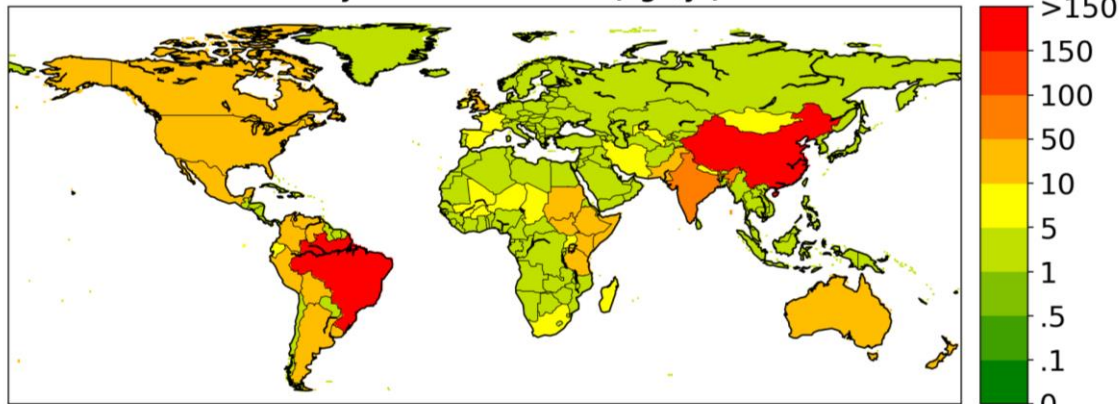

**Total livestock feed demand
2,450 Tg C/yr**

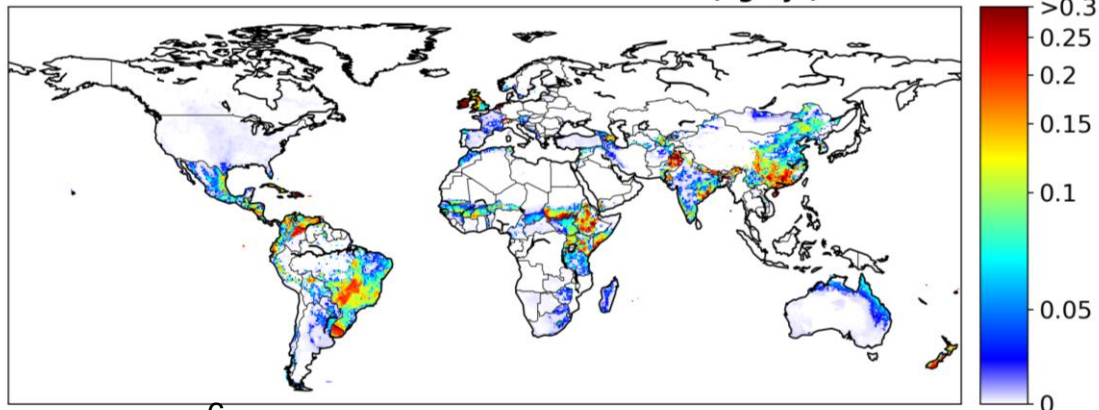

Redistribution of feed demand from country scale to grid level

Pasture feed (1,076 Tg C/yr) produced on grazing land

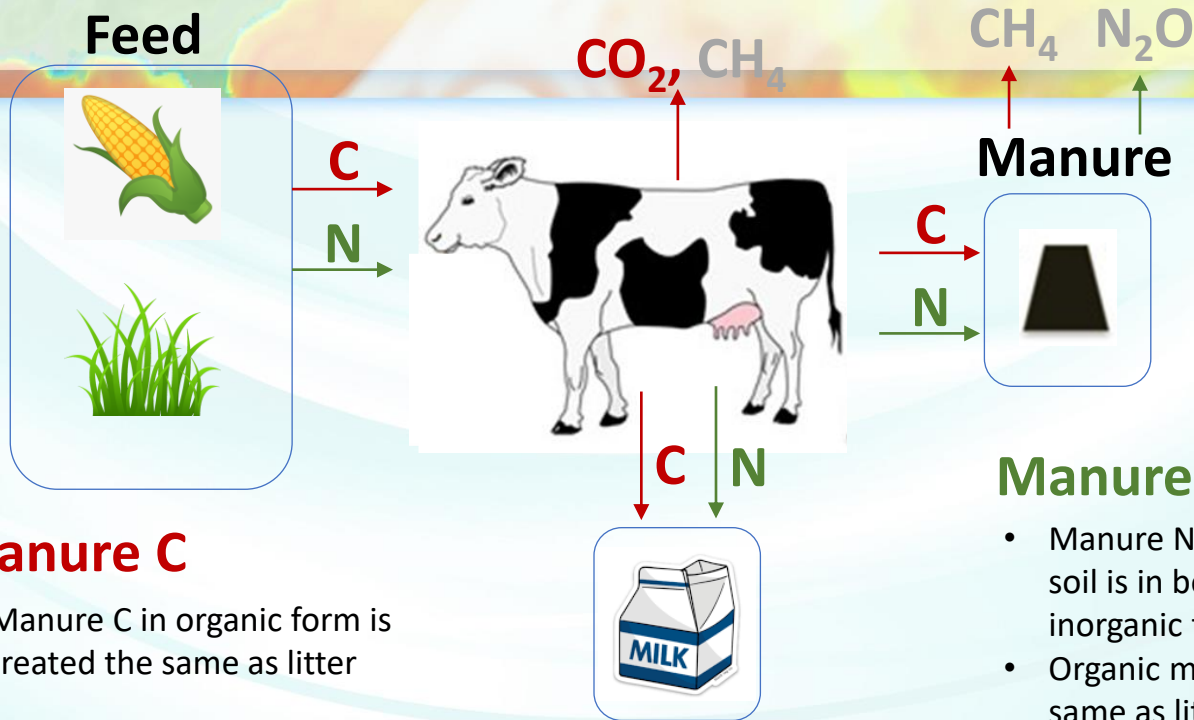

Countrywise Feed Demand(TgC/yr)

Grided at 30min resolution Feed Demand(TgC/yr)

Feed and Manure C and N

Manure C

- Manure C in organic form is treated the same as litter

Manure N

- Manure N returned back to the soil is in both organic and inorganic forms
- Organic manure N is treated the same as litter
- Inorganic manure N is inputted into soil inorganic N pool

Our analysis make a distinction between E_{luc} and E_{farm} carbon flux calculation

$$\text{Net agriculture carbon flux} = E_{farm} + E_{luc}$$

$$1) E_{luc} = E_{p_1yr} + E_{p_10yr} + E_{p_100yr} + E_{p_1000yr} + E_{soil}$$

E_{p_1yr} : emissions from 1-year product pool

E_{p_10yr} : emissions from 10-year product pool

E_{p_100yr} : emissions from 100-year product pool

E_{p_1000yr} : emissions from 1000-year product pool

E_{soil} : emissions from soil disturbance caused by land use change

$$2) E_{farm} = NEE + E_{h_CO2} + E_{t_CO2} + E_{w_CO2}$$
$$NEE = R_a + R_h - GPP$$

NEE: Net Ecosystem Exchange

GPP: Gross Primary Productivity

R_a : Autotrophic Respiration

R_h : Heterotrophic Respiration

E_{h_CO2} : Carbon loss due to harvest of biomass

E_{t_CO2} : Carbon loss due to soil tillage

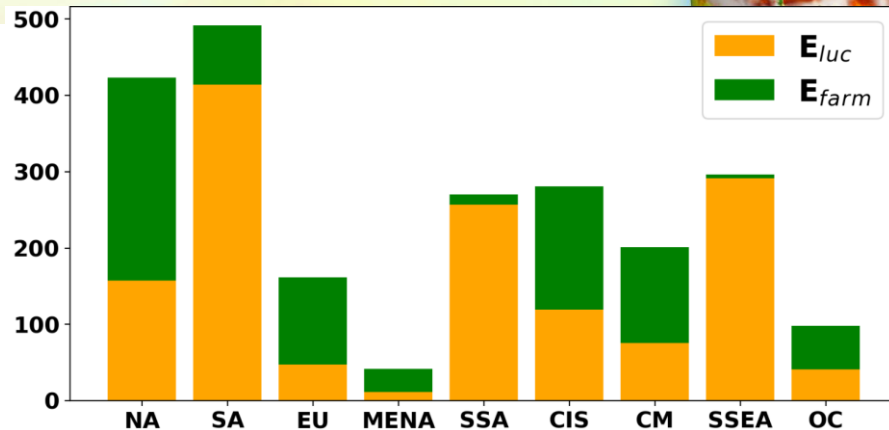

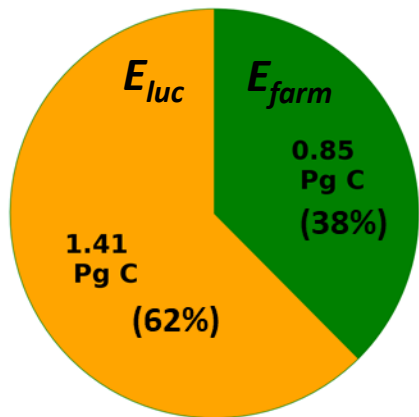

E_{w_CO2} : Carbon loss due to burning

Results (discuss based on 9 macro-geographical regions)

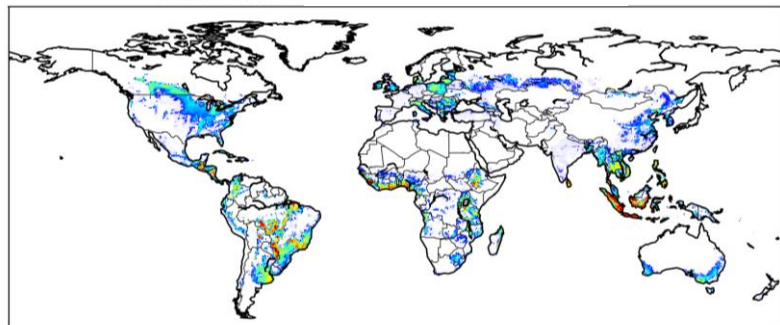

E_{luc} and E_{farm} fluxes in 2010

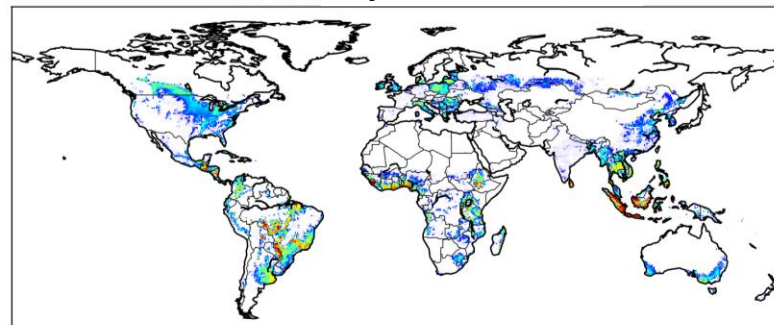

Total Agriculture net carbon flux: 2.26 Pg C/yr

E_{luc} (Tg C/yr)

E_{farm} (Tg C/yr)

E_{luc} and E_{farm} on cropland and grazing land

Cropland

E_{luc} (Tg C/yr)

E_{farm} (Tg C/yr)

Grazing land

Regional & Global Carbon flux of grazingland and cropland

Top three contributing crops

E_{luc} (Tg C/yr)

E_{farm} (Tg C/yr)

LULCC Carbon flux of Rice(Tg C/yr)

Farmland Carbon flux of Rice(Tg C/yr)

LULCC Carbon flux of Maize(Tg C/yr)

Farmland Carbon flux of Maize(Tg C/yr)

LULCC Carbon flux of Wheat(Tg C/yr)

Farmland Carbon flux of Wheat(Tg C/yr)

Rice

■ E_{luc} - 61 %
■ E_{farm} - 39 %

Maize

■ E_{luc} - 46 %
■ E_{farm} - 54 %

Wheat

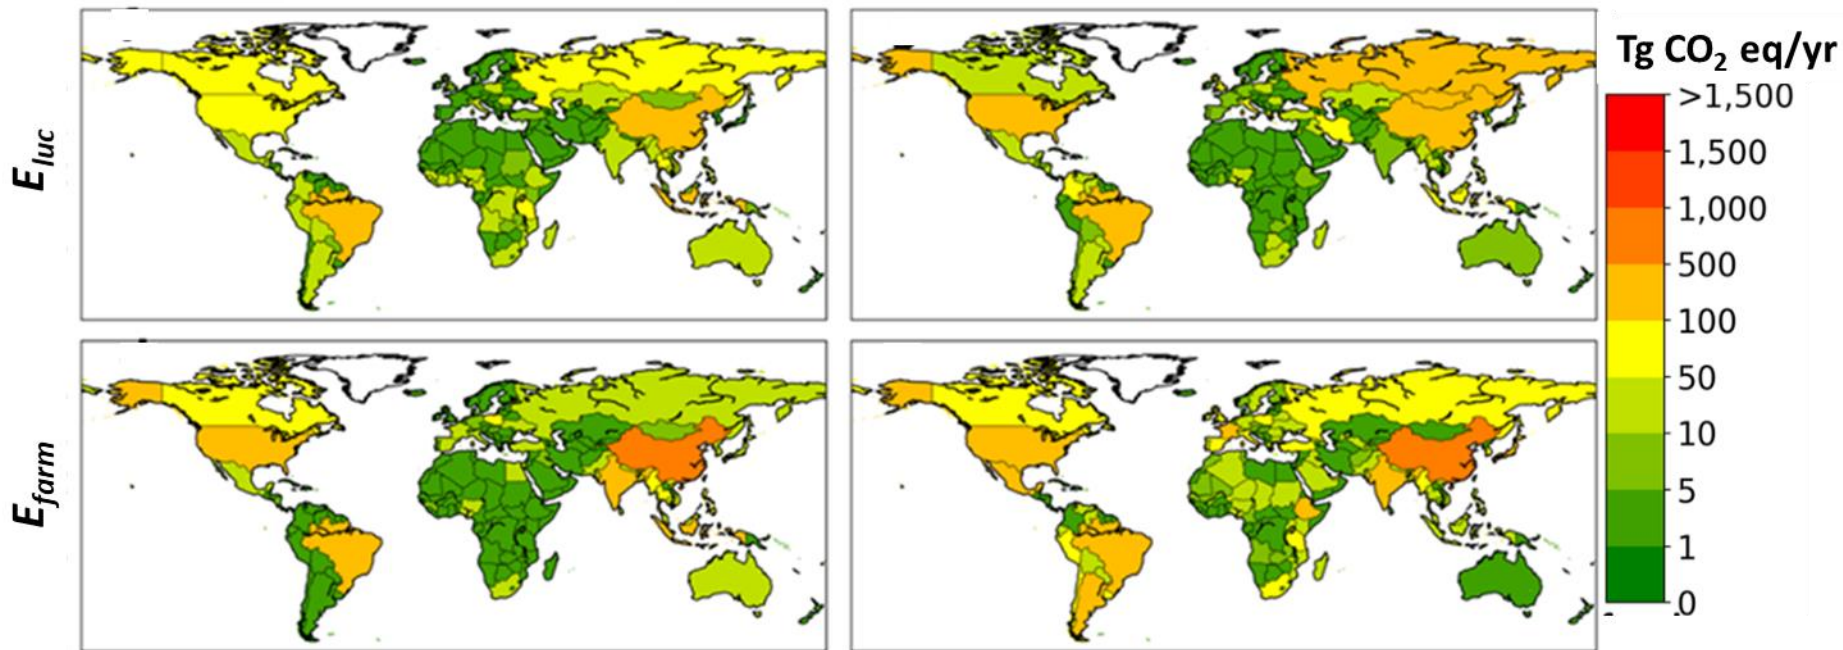

■ E_{luc} - 55 %
■ E_{farm} - 45 %

E_{luc} and E_{farm} for plant- and animal-based food at country scale

Plant-based food

Animal-based food

Summary

- Agricultural land is a net carbon source with the flux 2.26 Pg C/yr in 2010
- Emissions from farmland management activities contribute to 38% and land use change contribute 62% to total emissions
- South America and North America are the largest emitting regions
- Cropland and grazing land contribute 72% and 28% to total emission
- Maize, rice and wheat are the major contributing crops

Next

- Implement the land management practices, especially the C and N dynamics caused by feed-manure cycle in the ELM
- Implement mosaic structure in ELM to calculate the soil properties
- Perform ELM simulations for the future to compare the carbon, water and energy fluxes between ISAM and LUH2 LULCC datasets

Thank you!
